Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

               This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency % (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline proteases (47%) from bacillus sp strain KSM-KP43 which is used to create the modified protease represented in AAM50090.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  AGARIHTNSWGAAVNGAYTTDSRNVDDYVRKNDMTILFAAGNEGPNGGTISAPGTAKNAI 180

                                                                                                                                                                              The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the ph range 4-13 and has at least 80% of its optimum stable over the ph range 6-11; (b) after 30 minutes at 40 deg. C it is stable over the ph range 6-11; (c) after 30 minutes at 40 deg. C it is stable over the ph range 6-11; (d) after 30 minutes at 40 deg. C it is sability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the pleaches. The present sequence represents an alkaline protease. (Updated on 20-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             241 WANHDSKYAYMGGTSMATPIVAGNVAQLREHFVKNRGITPKPSLLKAALIAGAADIGLGY

The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by C Bacillus. The protease a high stability to oxidising agents. The coleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum stability over the range 6-11; (b) after 30 minutes at 40 deg. C it is stable over the pH range 6-11; (c) its isoelectric point is 8.9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the corpus to be an effective component of washing compositions including bleaches. The present sequence represents an alkaline protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NANDINGHGTHVAGSVLGNGSTNKGMAPQANLVFQSIMDSGGGLGGLPSNLQTLFSQAYS 120

             This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency $ (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline proteases KP9860 from Bacillus sp strain KSM-KP9860 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 NANDTNGHGTHVAGSVLGNGSTNKGMAPQANLVFQSIMDSGGGLGGLPSNLQTLFSQAYS 120

                                                                       ŏλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the range put 6-12; (b) after 30 minutes at 40 deg. (it is perheit) expect the put range 6-11; (b) after 30 minutes at 40 deg. (c) it is stable over the put range 6-11; (c) its isoelectric point is 8.9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the enzyme to be an effective component of washing compositions in alkaline protease. (updaches. The present sequence represents an alkaline protease.

                                          Bacillus. The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the range pH 6-13; (b) after 30 minutes at 40 deg. C it is stable over the pH range 6-11; c) its isoelectric point is 8.9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be
                                                                                                                                                                                                                                                                                                                                                                                            61 NANDTNGHGTHVAGSVLGNGSTNKGMAPQANLVFQSIMDSGGGLGGLPSNLQTLFSQAYS 120

The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to exidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the range pH 6-12; (b) after 30 minutes at 40 deg. C it is stable over the pH range 5-11; c) its isoelectric point is 8.9-9-1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the pleaches. The present sequence represents an alkaline protease of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency % (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline protease A-1 from Bacillus sp NCIB12289 described in the method of the invention.

This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency % (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline protease A-2 from Bacillus sp NCIB12513 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 NANDTNGHGTHVAGSVLGNGSTNKGMAPQANLVFQSIMDSGGGLGGLPSNLQTLFSQAYS 120

                                                                                                                                                This is the amino acid sequence of a novel protease of Bacillus sp. JP170 (NCIB 12513), as deduced from the nucleotide sequence of an isolated gene (see AAV82382). The entire protein, including the protease I (see AAV89548) from Bacillus. The invention provides vectors, recombinant host cells and methods for the recombinant peroduction of the protease. The protease is used in laundry and dishwashing detergents, for institutional and industrial cleaning, and for leather processing, as well as for debittering and

enhancing the degree of hydrolysis of protein hydrolysates, for flavour development through hydrolysis of proteins, degradation of undesired peptides and in enzymatic synthesis of peptides. It has enhanced stability towards oxidation under alkaline conditions, e.g. towards bleaching agents of the peroxy type. The invention also provides mutant cells in which the protease activity is diminished. Such cells can be used for the production of

The novel proteases have an increased detergency $ (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a variant of the alkaline protease KP43 from Eacillus sp strain KSM-KP43 createdfrom the wild-type protease
                                                                                                                                                                                                                                                                                                                                                                                                                               61 NANDTNGHGTHVAGSVLGNGSTNKGMAPQANLVFQSIMDSGGGLGGLPSNLQTLFSQAYS 120

                                                                                                                                                                                         This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency 8 (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline protease SD-521 from Bacillus sp strain SD-521 (FERM BP-11162) described in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the amino acid sequence of a Bacillus sp. alkaline protease of Y that is said to have good alkali and surfactant resistance and improved detergency. It shows 77% identity to a newly isolated protease (see AAW89547) of Bacillus sp. JP170 (NCIB 12513). The protease (see AAW89547) of Bacillus sp. JP170 (NCIB 12513). The cinvention provides vectors, recombinant host cells and methods for the recombinant production of such proteases. The protease are used in laundry and dishwashing detergents, for institutional and cindustrial cleaning, and for leather processing, as well as for debittering and enhancing the degree of hydrolysis of proteins, degradation of undesired peptides and in enzymatic synthesis of peptides. They have enhanced stability towards oxidation under alkaline conditions, e.g. towards bleaching agents of the peroxy type. The invention also provides mutant cells in which the protease activity is diminished. Such cells can be used for the production of heterologous recombinant proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 NDVARGIVKADVAQSSYGLYGQGQIVAVADTGLDTGRNDSSMHEAFRGKITALYALGRTN

```
This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency % (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline protease Ya from Bacillus sp strain Y-(FERM BP-1029) described in the method of the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80
                                                                                                                                                                                                                                           The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the range pH 6-12; (b) after 30 minutes at 40 deg. C it is stable over the pH range 6-11; c) its isoelectric point is 8-9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4.0
                                                                                                                                                                                                                                                                                                                                                               used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the enzyme to be an effective component of washing compositions including bleaches. The present sequence represents an alkaline protease encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GGACAAGGACAGATCGTAGCGGTTGCCGATACAGGGCTTGATACAGGTCGCAATGACAGT

The invention relates to alkaline proteases produced by strains of bacillus. The proteases ability to digest casein is not inhibited by oleic acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the pH range 6-11; (b) after 30 minutes at 40 deg. C it is stable over the pH range 6-11; c) its isoelectric point is 8-9-1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SerThrAsnLysGlyMetAlaProGlnAlaAsnLeuValPheGlnSerIleMetAspSer 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and for washing clothes. The stability to oxidising agents allows the enzyme to be an effective component of washing compositions including bleaches. The present sequence represents an alkaline protease encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ASnAspvalAlaArgGlyIleValLysAlaAspvalAlaGlnSerSerTyrGlyLeuTyr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GlyGlnGlyGlnIleValAlaValAlaAspThrGlyLeuAspThrGlyArgAsnAspSer

                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by cleic acid and they have a high stability to oxidiasing agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the pH range 6-12; (b) after 30 minutes at 40 deg. C it is stability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the enzyme to be an effective component of washing compositions including bleaches. The present sequence represents an alkaline protease encoding

      AAV82382
```

This nucleotide sequence encodes a novel protease (see AAW82382) of Bacillus sp. JP170 (NCIB 12513). The sequence in plasmid p170BAN is contained in Bacillus subtilis LC20 NRRL B-21680. The protease Gene was isolated from chromosomal DNA of DP170 (Dollowing preparation of probes based on protease N-terminal and internal properties (see AAW89549-50), screening of chromosomal libraries, isolation of the 3' end of the gene by inverse PCR (see AAW82410-11), reconstruction of 5' and 3' ends and pCR amplification (see AAW8412-16). Claimed recombinant host cells can be used in a method for producing the protease. The protease is used in laundry and for producing the protease. The protease is used in laundry and and for leather processing, as well as for deblitering and enhancing the degree of hydrolysis of proteins, degradation of undesired peptides and in enzymatic synthesis of peptides. It has enhanced stability towards oxidation under alkaline conditions, calso provides mutant cells in which the protease activity is diminished. Such cells can be used for the production of the terologous recombinant proteins.

The invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40-110 deg.C (optimum 80-95 deg.C), working pth 5-10 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg.C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Ala-Gly-Gly-Asn-PRO, where SIG is a signal peptide from subtilisin, and PRO is the above protease. Host cells genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.

The invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working emperature 40-110 deg-C (optimum 80-95 deg-C), working pH 5-100 cotimum 6-8), and retains more a hyperthermostable coting cotimum 6-8), and retains more and coting man 6-80 coting man 6-80.	416 ValGInAlaTyrAsnValProValGIyProGInThrPheserLeualallealasn 434 [1] ::: ::: 1555 GTCGTCAGCTACAG	416 ValGlnAlaTyrAsnValProValGlyProGlnThrPheSerLeuAialleValAsn 434 [11] ::: 1555 GTGGTCAGCTACAAGGGCGGGGAACTACCAGGTCGACGTCGTCGGC 1602 805920 AAX05920 standard; DNA; 1236 BP.                          This sequence represents the coding sequence for the protease from Pyrococcus furiosus DSM-3638. This sequence encodes a protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.

This sequence encodes a protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aGlyAsnGluGlyProAsnGlyGlyThrIleSerAlaProGlyThrAlaLysAsnAlall 180
                                                                                                                                                                                  The invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40-110 deg.C (optimum 80-95 deg.C), working pH 5-10 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg.C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Ala-Gly-Gly-Asn-PRO, where SIG is a signal peptide from subtilisin, and PRO is the above protease. Host cells (especially Bacillus strains) transformed with vectors comprising the genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.

                                                                                                                                                                                                                                                                                                                                      This sequence represents the coding sequence for a protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.

```
asymmetric hydrolase which acts on 4-substituted-1,4-dihydropyridine derivatives. The enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially hydrolysed derivatives, for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 1010 AAGGCGTGAAGATCGCCGTCTGGACACCGGTGTCGACACGAGC--------1054

                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a fusion gene encoding Streptomyces viridosporus dhpA gene product (an asymmetric hydrolase) which acts on 4-substituted-1,4-dihydropyridine derivatives, and melanin from S. antibloticus. The DhpA enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially hydrolysed derivatives, for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 22 GlnGlyGlnIleValAlaValAlaAspThrGlyLeuAspThrGlyArgAsnAspSerSer
